**PRIORITY DOCUMENT**  
SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH  
RULE 17.1(a) OR (b)

REC'D 26 MAR 2004

WIPO

PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

## Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

DUPLICATE

1

1   **Specific Binding Members and Uses Thereof"**

2

3   The present invention relates to specific binding  
4   members and their use in therapy. In particular, the  
5   invention relates to specific binding members which  
6   bind to CD55, their use in the modulation of  
7   complement activation and the treatment of disease,  
8   for example, neoplastic disease.

9

10   The human complement system consists of a highly  
11   efficient recognition and effector mechanism that  
12   consists of 30 serum or cellular components  
13   including activated proteins, receptors and positive  
14   and negative regulators. In brief, the complement  
15   cascade consists of a triggering step, an  
16   amplification step with a feedback loop and finally,  
17   a membrane attack or lytic step. The central  
18   component of the complement system is C3. Generation  
19   of C3b by the classical or alternative pathway is  
20   crucial for opsonisation and lysis. The classical  
21   pathway is initiated when component C1 via its C1q  
22   subcomponent attaches to an antibody to form an

1 immune complex. For the alternative pathway,  
2 however, there is no initiating factor equivalent to  
3 antibody. Rather it is in a state of continuous,  
4 low level activation as a result of spontaneous  
5 hydrolysis of a thioester group in native C3. This  
6 results in binding of C3 to non-specific acceptor  
7 molecules in plasma or on cell surfaces. This can  
8 result in the formation of C3 convertases and  
9 creation of a feedback loop. Because of its potent  
10 pro-inflammatory and destructive capabilities, there  
11 is a regulatory system designed to prevent  
12 complement activation both in the fluid phase and on  
13 bystander tissues.

14  
15 There are four membrane bound complement regulatory  
16 proteins namely complement receptor 1 (CR1), CD55,  
17 CD46 and CD59 (Liszewski et al 1996. Adv Immunol  
18 61:201-283). Regulation is either accomplished by:

- 19  
20 1. Spontaneous decay of activated proteins and  
21 enzyme complex (i.e. short half life)  
22 2. Destabilisation and inhibition of activation  
23 complexes  
24 3. Proteolytic cleavage of "activated" components.

25  
26 CD46, CD55 and CD59 are widely expressed on many  
27 tissues, including surface epithelia and tumour  
28 tissues. In contrast, CR1 expression is limited to  
29 peripheral blood cells and is therefore not directly  
30 involved in protection of solid tumours.

31

1 Most tumours are of epithelial origin and, although  
2 most surface epithelia express complement regulatory  
3 proteins, tumours show variable expression of CD55,  
4 CD46 and CD59. The majority of colorectal and  
5 thyroid cancers express high levels of all three  
6 complement regulatory proteins (Niehans et al., 1996  
7 Am J Pathol 149:129-142; Li et al., 2001 Br. J.  
8 Cancer 84:80-86; Thorsteinsson, 1998 APMIS 106:869-  
9 878; Yamakawa et al., 1994 Cancer 73:2808-2817).  
10 Ductal carcinoma of the breast shows the most  
11 variation in phenotype with some tumours expressing  
12 only one inhibitor while others express different  
13 combinations of two or three inhibitors (Niehans et  
14 al., 1996 supra; Thorsteinsson et al., 1998 supra).  
15 Renal cell carcinoma has weak to moderate expression  
16 of one to three inhibitors, generally CD55 and CD59  
17 (Niehans et al., 1996 supra) whereas non-small cell  
18 lung carcinomas and ovarian and cervical cancers  
19 usually express CD59 and CD46 with variable CD55  
20 immunoreactivity (Niehans et al., 1996 supra; Bjorge  
21 et al., 1977 Cancer Immunol Immunother 42:185-192;  
22 Simpson et al., 1997 Am J Pathol 151:1455-1467).  
23 Similar results have been obtained with established  
24 cell lines (Bjorge et al., 1996 supra; Gorter et al  
25 1986 Lab Invest 74 1; Juhl et al., 1997 J. Surgical  
26 Oncol. 64:222-230; Li et al., 2001 supra).  
27  
28 All three complement regulatory proteins are  
29 expressed on vascular endothelium. Their specific  
30 roles during inflammation when the risk of  
31 complement mediate injury may be increased remains  
32 to be determined. CD55, but not CD46 or CD59, is

1 up-regulated on endothelial cells by the pro-  
2 inflammatory mediators  $\text{TNF}\alpha$ ,  $\text{IL-1}\beta$ , and  $\text{IFN-}\gamma$ , and  
3 also by the MAC (membrane attack complex) and  
4 thrombin. These results suggest that CD55 is of  
5 critical importance in protecting endothelial cells  
6 from complement during inflammation and coagulation.  
7 Furthermore it has recently been shown that  
8 retraction of endothelial cells exposing sub-  
9 endothelial extracellular matrix is a potent inducer  
10 of the alternative complement pathway releasing  
11 anaphylatoxins that stimulate inflammation. As  
12 tumours frequently have dysregulated endothelium,  
13 with exposed vessel walls, the tumour environment  
14 may induce complement activation. This may be one  
15 of the reasons that tumour cells over-express  
16 complement regulatory receptors. However, it has  
17 been shown that both tumour cells and endothelial  
18 cells can actually secrete CD55 but not CD46 into  
19 their extracellular matrix (ECM) (Hindmarsh and  
20 Marks, 1998 J. Immunol. 160:6128-6136). Hindmarsh  
21 and Marks showed that tumour but not endothelial  
22 derived CD55 is functionally active and can prevent  
23 deposition of C3b. However, deposition of matrix  
24 CD55 could not be up-regulated by inflammatory  
25 cytokines. More recently the present inventors have  
26 shown that both CD55 and CD59 can be deposited into  
27 extracellular matrix by both tumours and endothelial  
28 cells and the latter can be considerably up-  
29 regulated by the potent angiogenesis growth factor  
30 VEGF (Li et al., 2001 supra). Furthermore, CD55  
31 deposited by endothelial cells stimulated with VEGF  
32 was shown to be functionally active. VEGF is

1 unusual, as it is the only cytokine identified to  
2 date that up-regulates both cell surface expression  
3 and deposition of CD55 into the ECM.

4  
5 As most tumours secrete high levels of VEGF to  
6 induce angiogenesis they will stimulate expression  
7 of CD55 on endothelial cells and within ECM.  
8 Interestingly immunohistochemistry of colorectal  
9 tumours with anti-CD55 monoclonal antibodies shows  
10 intense staining of tumour stroma (Li et al., 2001  
11 *supra*; Simpson et al., 1997 *supra*; Niehans et al.,  
12 1996 *supra*) and blood vessels (Niehans et al., 1996  
13 *supra*). CD55 deposited within ECM is covalently  
14 bound as it cannot be released by strong acids or  
15 alkalis.

16  
17 CD55 binds C3 convertases from both the classical  
18 and alternative complement pathways displacing C2b  
19 and C3b respectively. It can, therefore, prevent  
20 C3b deposition and inhibit the downstream assembly  
21 of the membrane attack complex. CD55 has an  
22 extracellular domain that is composed of 4  
23 contiguous short consensus (SCR) domains and a  
24 threonine/serine rich region proximal to the cell  
25 surface. It has a single N-glycosylation site  
26 between the first and second SCR domains and is  
27 heavily O-glycosylated in the threonine and serine  
28 rich regions. It is attached to the cell membrane  
29 by a glycoposphoinositol (GPI) anchor and is  
30 expressed by all cells exposed to complement,  
31 namely, red blood cells, leukocytes, endothelial and  
32 epithelial cells. CD55 has also been detected in

1 low amounts in plasma, saliva and urine. The  
2 biological significance of this soluble form remains  
3 unclear as it has never been shown to be  
4 functionally active. Recently it has been shown  
5 that HeLa cells and HUVEC incorporate CD55 into  
6 their extracellular matrix and that this covalently  
7 linked CD55 can inhibit C3b deposition and the  
8 release of the pro-inflammatory anaphylatoxin C3a  
9 (Hindmarsh and Marks, 1998 *supra*).

10

11 As well as making tumour cells susceptible to in  
12 situ complement activation, antibodies inhibiting  
13 the functions of complement regulatory proteins may  
14 also make tumour cells susceptible to monoclonal  
15 antibody mediated complement dependent cellular  
16 cytotoxicity. A chimeric anti-LewisY monoclonal  
17 antibody (CH18A) mediated modest complement mediated  
18 cell lysis of two lung adenocarcinomas cell lines.  
19 However addition of antibodies that block the  
20 function of CD46, CD55 and CD59 considerably enhance  
21 complement mediated lysis. Use of multiple blocking  
22 antibodies to the complement regulatory proteins  
23 produced more enhancement of CH18A mediated lysis  
24 than any single antibody (Azuma et al., 1995. *Scand*  
25 *J Immunol* 42:202-208). Several groups have generated  
26 bispecific antibodies with one arm targeting a  
27 tumour cell surface antigen and the other targeting  
28 the functional domain of a complement regulatory  
29 protein. A bispecific antibody targeting HLA and  
30 SCR3 of CD55 resulted in a 92% enhancement of C3b  
31 deposition on renal tumours. Similarly in the same  
32 study a bispecific antibody targeting a renal tumour

1 antigen and the SCR3 of CD55 resulted in a 25-400%  
2 increase in C3b deposition on renal tumours and  
3 rendered the cells susceptible to complement  
4 mediated lysis (Blok et al., 1998 J Immunol  
5 160:3437-3443). Finally when a chimeric anti-CD37  
6 monoclonal antibody was used to activate the  
7 classical complement pathway, a bispecific Fab'gamma  
8 construct targeting a lymphoma specific antigen and  
9 the CD59 functional domain increased cell lysis by  
10 3-5 fold (Harris et al., 1997 Clin. Exp. Immunol.  
11 107:364-371).

12  
13 However, although previous studies have shown that  
14 monoclonal antibodies recognising SCR3 of CD55 could  
15 partially neutralise CD55 leading to enhanced C3b  
16 deposition and assembly of the MAC complex, each of  
17 these antibodies merely compete for binding to SCR3  
18 with the C3 convertases and therefore only partially  
19 neutralise CD55. Molecular constructs of CD55 have  
20 shown that SCR3 is the active domain of CD55 and  
21 that SCR2 and SCR4 are necessary to provide the  
22 correct conformation for C3 binding. No role for  
23 SCR1 in complement decay has been shown. However,  
24 although SCR2 is necessary to provide the correct  
25 conformation for C3 binding, studies with monoclonal  
26 antibodies to single SCR domains of CD55 have shown  
27 that only monoclonal antibodies that bind to SCR3  
28 and not antibodies that bind to either SCR1 or SCR2  
29 can neutralise CD55 (Coyne et al, 1992 J Immunol  
30 149, 2906).  
31

1 Imaging studies with the monoclonal antibody 791T/36  
2 (Embleton et al 1981 Br.J. Cancer 43:582-587) in  
3 osteosarcomas, ovarian and colorectal tumours  
4 successfully imaged lesions as small as  $1\text{cm}^3$   
5 (Farrands et al 1982 Lancet 2:397-400; Farrands et  
6 al 1983. J. of Bone and Joint Surg. 65:638-640;  
7 Armitage et al., 1985. Nucl Med Commun 6:623-631).  
8 Furthermore autoradiography of the resected tumours  
9 showed both cell surface and intense stromal  
10 localisation of the antibody (Armitage et al., 1984  
11 Br J Surg 71:407-412). These studies illustrate that  
12 an anti-CD55 antibody can effectively localise in  
13 tumours without showing any normal tissue toxicity.  
14 In particular no detectable binding of radiolabeled  
15 antibody to blood cells and only background levels  
16 of radiolabel were seen on endothelium or normal  
17 tissues. The antigen recognised by 791T/36 was  
18 recently identified as CD55 (Spendlove et al Eur J  
19 Immunol. 30:2944-2953; Spendlove et al Cancer Res.  
20 59:2282-2286). Using CD55/CD46 chimeric constructs  
21 it was possible to map the binding site of 791T/36  
22 to the first two SCR domains of CD55 with peptide  
23 analysis showing that 791T/36 can bind to three  
24 distinct regions of SCR1-2 of CD55. One region is in  
25 SCR1 and two are in SCR2.  
26  
27 WO00/5204 discloses a method for making antibodies,  
28 for example antibodies directed against decay  
29 accelerating factor (DAF, using a naïve antibody  
30 phage library. Although the document refers to the  
31 use of such antibodies in cancer diagnosis or  
32 therapy, no examples are provided other than a

1 speculative example, in which antibody LU30 is  
2 suggested for use in assessing overexpression of DAF  
3 and for treatment of lung cancer particularly when  
4 combined with cytotoxic agents.

5

6 WO/04415 describes the production of the anti-  
7 idiotype antibody 105AD7 which was raised against  
8 antibody 791T/36 and speculates on potential  
9 therapeutic uses of the 105AD7 antibody.

10

11 However, to date, no therapeutically useful anti-  
12 CD55 antibodies other than anti SCR3 antibodies have  
13 been demonstrated. Therapeutic studies with  
14 antibodies directed to other SCRs of this molecule  
15 have been limited to immunoconjugated molecules.  
16 (See for example US 4916213 (Xoma Corporation), US  
17 4925922 (Xoma Corporation) and Byers et al. 1987  
18 Cancer Res 47:5042-5046). For example, Byers et al  
19 describes studies with 791T/36 linked to ricin A  
20 chain, showed significantly inhibition of tumour  
21 growth in athymic mice. 791T/36-RTA was therefore  
22 screened in a phase I clinical trial in advanced  
23 colorectal cancer patients (Byers et al 1989. Cancer  
24 Research 49:6153-6160). However the trial was  
25 unsuccessful due to dose limiting toxicity.

26

27 Surprisingly, the present inventors have now  
28 demonstrated that, although previous studies have  
29 demonstrated that antibodies which target either SCR  
30 1 or SCR 2 of CD55 failed to have any neutralisation  
31 effect on CD55, an antibody which targets both SCR 1

1 and SCR2 not only effectively neutralises CD55 but  
2 is superior to a SCR3 neutralising antibody.

3

4 Accordingly, in a first aspect, the present  
5 invention provides a method of neutralisation of  
6 CD55, comprising administration of a naked binding  
7 member which specifically binds to SCR1 and SCR2 of  
8 CD55.

9

10 By neutralising CD55, enhanced complement deposition  
11 may be facilitated. Accordingly, in a second aspect,  
12 the invention provides a method of enhancing  
13 complement deposition on a tissue comprising  
14 administration of a naked binding member which  
15 specifically binds to SCR1 and SCR2 of CD55.

16

17 The methods of the invention may be used *in vitro* or  
18 *in vivo*.

19

20 As described above, CD55 is commonly found on many  
21 tumour cell surfaces, where it serves to inhibit  
22 complement deposition. By neutralising such  
23 molecules on tumour cells, the methods of the  
24 invention enable complement mediated attack of  
25 tumour cells. Accordingly, in a further aspect of  
26 the present invention, there is provided a method of  
27 treating cancer comprising administration of a  
28 therapeutically effective amount of a naked binding  
29 member which specifically binds to SCR1 and SCR2 of  
30 CD55 to a mammal in need thereof.

31

1 In a further aspect, there is provided the use of  
2 (i) a naked binding member which binds to both SCR1  
3 and SCR2 of CD55 or (ii) a nucleic acid encoding  
4 said binding member in the preparation of a  
5 medicament for the neutralisation of CD55.

6

7 In a further aspect, there is provided a naked  
8 binding member which binds to both SCR1 and SCR2 for  
9 use in the treatment of cancer.

10

11 In a further aspect, there is provided the use of  
12 (i) a naked binding member which binds to both SCR1  
13 and SCR2 of CD55 or (ii) a nucleic acid encoding  
14 said binding member in the preparation of a  
15 medicament for treating cancer.

16

17 The present invention also provides a pharmaceutical  
18 composition for the treatment of cancer, wherein the  
19 composition comprises a naked binding member that  
20 binds to both SCR1 and SCR2 of CD55.

21

## 22 Specific Binding Member

23

24 As used herein, a "binding member" is a member of a  
25 pair of molecules which have binding specificity for  
26 one another. The binding member is, therefore, a  
27 specific binding member. The members of a binding  
28 pair may be naturally derived or wholly or partially  
29 synthetically produced. One member of the pair of  
30 molecules may have an area on its surface, which may  
31 be a protrusion or a cavity, which specifically  
32 binds to and is therefore complementary to a

1 particular spatial and polar organisation of the  
2 other member of the pair of molecules. Thus, the  
3 members of the pair have the property of binding  
4 specifically to each other. Examples of types of  
5 binding pairs are antigen-antibody, biotin-avidin,  
6 hormone-hormone receptor, receptor-ligand, enzyme-  
7 substrate. The present invention is concerned with  
8 antigen-antibody type reactions, although a binding  
9 member of the invention and for use in the invention  
10 may be any moiety which can bind to both SCR1 and  
11 SCR2 of CD55.

12

13 As used herein, "naked" means that the binding  
14 member of or for use in the present invention is not  
15 bound to, for example conjugated with, any agent,  
16 for example ricin, having anti-tumour properties.

17

#### 18 Antibodies

19

20 An "antibody" is an immunoglobulin, whether natural  
21 or partly or wholly synthetically produced. The  
22 term also covers any polypeptide, protein or peptide  
23 having a binding domain which is, or is homologous  
24 to, an antibody binding domain. These can be  
25 derived from natural sources, or they may be partly  
26 or wholly synthetically produced. Examples of  
27 antibodies are the immunoglobulin isotypes and their  
28 isotypic subclasses and fragments which comprise an  
29 antigen binding domain such as Fab, scFv, Fv, dAb,  
30 Fd; and diabodies.

31

1 The binding member of the invention may be an  
2 antibody such as a monoclonal or polyclonal  
3 antibody, or a fragment thereof. The constant region  
4 of the antibody may be of any class including, but  
5 not limited to, human classes IgG, IgA, IgM, IgD and  
6 IgE. The antibody may belong to any sub class e.g.  
7 IgG1, IgG2, IgG3 and IgG4. IgG1 is preferred. In  
8 preferred embodiments the antibody is 791T/36  
9 produced by the cell line deposited with ATCC under  
10 accession no. HB9173.

11  
12 As antibodies can be modified in a number of ways,  
13 the term "antibody" should be construed as covering  
14 any binding member or substance having a binding  
15 domain with the required specificity. Thus, this  
16 term covers antibody fragments, derivatives,  
17 functional equivalents and homologues of antibodies,  
18 including any polypeptide comprising an  
19 immunoglobulin binding domain, whether natural or  
20 wholly or partially synthetic. Chimeric molecules  
21 comprising an immunoglobulin binding domain, or  
22 equivalent, fused to another polypeptide are  
23 therefore included. Cloning and expression of  
24 chimeric antibodies are described in EP-A-0120694  
25 and EP-A-0125023.

26  
27 It has been shown that fragments of a whole antibody  
28 can perform the function of binding antigens.  
29 Examples of such binding fragments are (i) the Fab  
30 fragment consisting of VL, VH, CL and CH1 domains;  
31 (ii) the Fd fragment consisting of the VH and CH1  
32 domains; (iii) the Fv fragment consisting of the VL

1 and VH domains of a single antibody; (iv) the dAb  
2 fragment (Ward, E.S. et al., *Nature* 341:544-546  
3 (1989)) which consists of a VH domain; (v) isolated  
4 CDR regions; (vi) F(ab')<sub>2</sub> fragments, a bivalent  
5 fragment comprising two linked Fab fragments (vii)  
6 single chain Fv molecules (scFv), wherein a VH  
7 domain and a VL domain are linked by a peptide  
8 linker which allows the two domains to associate to  
9 form an antigen binding site (Bird et al., *Science*  
10 242:423-426 (1988); Huston et al., *PNAS USA* 85:5879-  
11 5883 (1988)); (viii) bispecific single chain Fv  
12 dimers (PCT/US92/09965) and (ix) "diabodies",  
13 multivalent or multispecific fragments constructed  
14 by gene fusion (WO94/13804; P. Hollinger et al.,  
15 *Proc. Natl. Acad. Sci. USA* 90:6444-6448 (1993)).  
16

17 A fragment of an antibody or of a polypeptide for  
18 use in the present invention, for example, a  
19 fragment of the 791T/36 antibody, generally means a  
20 stretch of amino acid residues of at least 5 to 7  
21 contiguous amino acids, often at least about 7 to 9  
22 contiguous amino acids, typically at least about 9  
23 to 13 contiguous amino acids, more preferably at  
24 least about 20 to 30 or more contiguous amino acids  
25 and most preferably at least about 30 to 40 or more  
26 consecutive amino acids. A preferred group of  
27 fragments are those which include all or part of the  
28 CDR regions of monoclonal antibody 791T/36. A  
29 preferred group of fragments are those which include  
30 all or part of the CDR regions of monoclonal  
31 antibody 791T/36.  
32

1 A "derivative" of such an antibody or polypeptide,  
2 or of a fragment of a 791T/36 antibody means an  
3 antibody or polypeptide modified by varying the  
4 amino acid sequence of the protein, e.g. by  
5 manipulation of the nucleic acid encoding the  
6 protein or by altering the protein itself. Such  
7 derivatives of the natural amino acid sequence may  
8 involve insertion, addition, deletion and/or  
9 substitution of one or more amino acids, preferably  
10 while providing a peptide having anti-CD55 activity,  
11 for example, CD55 neutralisation activity.  
12 Preferably such derivatives involve the insertion,  
13 addition, deletion and/or substitution of 25 or  
14 fewer amino acids, more preferably of 15 or fewer,  
15 even more preferably of 10 or fewer, more preferably  
16 still of 4 or fewer and most preferably of 1 or 2  
17 amino acids only.

18  
19 The term "antibody" includes antibodies which have  
20 been "humanised". Methods for making humanised  
21 antibodies are known in the art. Methods are  
22 described, for example, in Winter, U.S. Patent No.  
23 5,225,539. A humanised antibody may be a modified  
24 antibody having the hypervariable region of a  
25 monoclonal antibody such as 791T/36 and the constant  
26 region of a human antibody. Thus the binding member  
27 may comprise a human constant region.

28  
29 The variable region other than the hypervariable  
30 region may also be derived from the variable region  
31 of a human antibody and/or may also be derived from  
32 a monoclonal antibody such as 791T/36. In such

1 case, the entire variable region may be derived from  
2 murine monoclonal antibody 791T/36 and the antibody  
3 is said to be chimerised. Methods for making  
4 chimerised antibodies are known in the art. Such  
5 methods include, for example, those described in  
6 U.S. patents by Boss (Celltech) and by Cabilly  
7 (Genentech). See U.S. Patent Nos. 4,816,397 and  
8 4,816,567, respectively.

9  
10 It is possible to take monoclonal and other  
11 antibodies and use techniques of recombinant DNA  
12 technology to produce other antibodies or chimeric  
13 molecules which retain the specificity of the  
14 original antibody. Such techniques may involve  
15 introducing DNA encoding the immunoglobulin variable  
16 region, or the complementary determining regions  
17 (CDRs), of an antibody to the constant regions, or  
18 constant regions plus framework regions, of a  
19 different immunoglobulin. See, for instance, EP-A-  
20 184187, GB 2188638A or EP-A-239400. A hybridoma or  
21 other cell producing an antibody may be subject to  
22 genetic mutation or other changes, which may or may  
23 not alter the binding specificity of antibodies  
24 produced.

25  
26 In preferred embodiments of the invention, the  
27 binding member binds to CD55 SCR1 (amino acids 83-  
28 93) and SCR2 (amino acids 101-112 and amino acids  
29 145-157) of the sequences shown in Figure 1b.

30  
31 The binding member may comprise one or more of the  
32 CDRs of the antibody, or a fragment thereof,

1 produced by the cell line deposited at ATCC under  
2 accession number HB9173.

3  
4 As described above, in a preferred embodiment of the  
5 invention, the binding member is the antibody  
6 791T/36 produced by the hybridoma cell deposited  
7 under ATCC accession number HB9173. As used herein,  
8 reference to "791T/36" includes sequences which show  
9 substantial homology with 791T/36. Preferably the  
10 degree of homology between 791T/36 complementary  
11 determining regions (CDRs) and the CDRs of other  
12 antibodies will be at least 60%, more preferably  
13 70%, further preferably 80%, even more preferably  
14 90% or most preferably 95%.

15  
16 The percent identity of two amino acid sequences or  
17 of two nucleic acid sequences may be determined by  
18 aligning the sequences for optimal comparison  
19 purposes (e.g., gaps can be introduced in the first  
20 sequence for best alignment with the sequence) and  
21 comparing the amino acid residues or nucleotides at  
22 corresponding positions. The "best alignment" is an  
23 alignment of two sequences which results in the  
24 highest percent identity. The percent identity is  
25 determined by the number of identical amino acid  
26 residues or nucleotides in the sequences being  
27 compared (i.e., % identity = number of identical  
28 positions/total number of positions x 100).

29

30 The determination of percent identity between two  
31 sequences can be accomplished using a mathematical  
32 algorithm known to those of skill in the art. An

1 example of a mathematical algorithm for comparing  
2 two sequences is the algorithm of Karlin and  
3 Altschul (1990) *Proc. Natl. Acad. Sci. USA*  
4 87:2264-2268, modified as in Karlin and Altschul  
5 (1993) *Proc. Natl. Acad. Sci. USA* 90:5873-5877. The  
6 NBLAST and XBLAST programs of Altschul, et al.  
7 (1990) *J. Mol. Biol.* 215:403-410 have incorporated  
8 such an algorithm. BLAST nucleotide searches can be  
9 performed with the NBLAST program, score = 100,  
10 wordlength = 12 to obtain nucleotide sequences  
11 homologous to nucleic acid molecules of the  
12 invention. BLAST protein searches can be performed  
13 with the XBLAST program, score = 50, wordlength = 3  
14 to obtain amino acid sequences homologous to protein  
15 molecules of the invention. To obtain gapped  
16 alignments for comparison purposes, Gapped BLAST can  
17 be utilised as described in Altschul et al. (1997)  
18 *Nucleic Acids Res.* 25:3389-3402. Alternatively,  
19 PSI-Blast can be used to perform an iterated search  
20 which detects distant relationships between  
21 molecules (*Id.*). When utilising BLAST, Gapped  
22 BLAST, and PSI-Blast programs, the default  
23 parameters of the respective programs (e.g., XBLAST  
24 and NBLAST) can be used. See  
25 <http://www.ncbi.nlm.nih.gov>.

26  
27 Another example of a mathematical algorithm utilised  
28 for the comparison of sequences is the algorithm of  
29 Myers & Miller, CABIOS (1989). The ALIGN program  
30 (version 2.0) which is part of the CGC sequence  
31 alignment software package has incorporated such an  
32 algorithm. Other algorithms for sequence analysis

1 known in the art include ADVANCE and ADAM as  
2 described in Torellis & Robotti (1994) *Comput. Appl.*  
3 *Biosci.*, 10 :3-5; and FASTA described in Pearson &  
4 Lipman (1988) *Proc. Natl. Acad. Sci.* 85:2444-8.  
5 Within FASTA, ktup is a control option that sets the  
6 sensitivity and speed of the search.

7  
8 Where high degrees of sequence identity are present  
9 there will be relatively few differences in amino  
10 acid sequence. Thus for example they may be less  
11 than 20, less than 10, or even less than 5  
12 differences.

13  
14 The present inventors have shown that antibodies  
15 directed to SCR1 and SCR2 of CD55, for example  
16 791T/36 antibodies and fragments and derivatives  
17 thereof can be used as cancer therapeutics to  
18 inactivate CD55 and make tumour cells susceptible to  
19 complement mediated attack. This is exemplified by  
20 localisation of the antibody within tumours of  
21 cancer patients and their subsequent enhanced  
22 survival (see the Examples). Accordingly the  
23 invention further provides the use of naked  
24 "fragments" or "derivatives" of 791T/36 or other  
25 polypeptides of the "791T/36" family which bind to  
26 both SCR1 and SCR2 CD55 epitopes in the preparation  
27 of an agent for treating cancer.

28  
29 The binding members may be administered alone or in  
30 combination with one or more further agents. Thus,  
31 the present invention further provides products  
32 comprising a naked binding member, which binds to

1 both SCR1 and SCR2 of CD55, and an active agent as a  
2 combined preparation for simultaneous, separate or  
3 sequential use in the treatment of cancer. Active  
4 agents may include chemotherapeutic agents  
5 including, Doxorubicin, taxol, 5-Fluorouracil (5  
6 FU), Leucovorin, Irinotecan, Mitomycin C,  
7 Oxaliplatin, Raltitrexed, Tamoxifen and Cisplatin  
8 which may operate synergistically with the binding  
9 member of the present invention. Other active agents  
10 may include suitable doses of pain relief drugs such  
11 as non-steroidal anti-inflammatory drugs (e.g.  
12 aspirin, paracetamol, ibuprofen or ketoprofen) or  
13 opiates such as morphine, or anti-emetics. The  
14 ability of the binding member to synergise with an  
15 active agent to enhance tumour killing may not be  
16 due to immune effector mechanisms but rather may be  
17 a direct consequence of inactivating CD55 allowing  
18 enhanced complement deposition and complement lysis.  
19 The binding member of the invention may carry a  
20 detectable label.

21

## 22 Treatment

23

24 "Treatment" includes any regime that can benefit a  
25 human or non-human animal. The treatment may be in  
26 respect of an existing condition or may be  
27 prophylactic (preventative treatment). Treatment may  
28 include curative, alleviation or prophylactic  
29 effects.

30

31 "Treatment of cancer" includes treatment of  
32 conditions caused by cancerous growth and includes

1 the treatment of neoplastic growths or tumours.  
2 Examples of tumours that can be treated by the  
3 system of the invention are, for instance, sarcomas,  
4 including osteogenic and soft tissue sarcomas,  
5 carcinomas, e.g., breast-, lung-, bladder-, thyroid-  
6 , prostate-, colon-, rectum-, pancreas-, stomach-,  
7 liver-, uterine-, cervical and ovarian carcinoma,  
8 lymphomas, including Hodgkin and non-Hodgkin  
9 lymphomas, neuroblastoma, melanoma, myeloma, Wilms  
10 tumor, and leukemias, including acute lymphoblastic  
11 leukaemia and acute myeloblastic leukaemia, gliomas  
12 and retinoblastomas.

13

14 The binding member may, upon binding to SCR1 and  
15 SCR2 of CD55 present on cancerous cells or tissues,  
16 including tumour and non-tumour cells, neutralise  
17 CD55 and enhance complement deposition and  
18 complement mediated lysis of these cells.

19

20 The compositions and methods of the invention may be  
21 particularly useful in the treatment of existing  
22 cancer and in the prevention of the recurrence of  
23 cancer after initial treatment or surgery.

24

#### 25 Administration

26

27 Binding members of the present invention may be  
28 administered alone but will preferably be  
29 administered as a pharmaceutical composition, which  
30 will generally comprise a suitable pharmaceutical  
31 excipient, diluent or carrier selected dependent on  
32 the intended route of administration.

1 Binding members of the present invention may be  
2 administered to a patient in need of treatment via  
3 any suitable route. The precise dose will depend  
4 upon a number of factors, including the precise  
5 nature of the member (e.g. whole antibody, fragment  
6 or diabody), and the nature of the detectable label  
7 attached to the member.

8  
9 Some suitable routes of administration include (but  
10 are not limited to) oral, rectal, nasal, topical  
11 (including buccal and sublingual), vaginal or  
12 parenteral (including subcutaneous, intramuscular,  
13 intravenous, intradermal, intrathecal and epidural)  
14 administration. Intravenous administration is  
15 preferred.

16  
17 It is envisaged that injections (intravenous) will  
18 be the primary route for therapeutic administration  
19 of the compositions although delivery through a  
20 catheter or other surgical tubing is also envisaged.  
21 Liquid formulations may be utilised after  
22 reconstitution from powder formulations.

23  
24 For intravenous, injection, or injection at the site  
25 of affliction, the active ingredient will be in the  
26 form of a parenterally acceptable aqueous solution  
27 which is pyrogen-free and has suitable pH,  
28 isotonicity and stability. Those of relevant skill  
29 in the art are well able to prepare suitable  
30 solutions using, for example, isotonic vehicles such  
31 as Sodium Chloride Injection, Ringer's Injection,  
32 Lactated Ringer's Injection. Preservatives,

1 stabilisers, buffers, antioxidants and/or other  
2 additives may be included, as required.

3  
4 Pharmaceutical compositions for oral administration  
5 may be in tablet, capsule, powder or liquid form. A  
6 tablet may comprise a solid carrier such as gelatin  
7 or an adjuvant. Liquid pharmaceutical compositions  
8 generally comprise a liquid carrier such as water,  
9 petroleum, animal or vegetable oils, mineral oil or  
10 synthetic oil. Physiological saline solution,  
11 dextrose or other saccharide solution or glycols  
12 such as ethylene glycol, propylene glycol or  
13 polyethylene glycol may be included.

14  
15 The composition may also be administered via  
16 microspheres, liposomes, other microparticulate  
17 delivery systems or sustained release formulations  
18 placed in certain tissues including blood. Suitable  
19 examples of sustained release carriers include  
20 semipermeable polymer matrices in the form of shared  
21 articles, e.g. suppositories or microcapsules.  
22 Implantable or microcapsular sustained release  
23 matrices include polylactides (US Patent No. 3, 773,  
24 919; EP-A-0058481) copolymers of L-glutamic acid and  
25 gamma ethyl-L-glutamate (Sidman et al, Biopolymers  
26 22(1): 547-556, 1985), poly (2-hydroxyethyl-  
27 methacrylate) or ethylene vinyl acetate (Langer et  
28 al, J. Biomed. Mater. Res. 15: 167-277, 1981, and  
29 Langer, Chem. Tech. 12:98-105, 1982). Liposomes  
30 containing the polypeptides are prepared by well-  
31 known methods: DE 3,218, 121A; Epstein et al, PNAS  
32 USA, 82: 3688-3692, 1985; Hwang et al, PNAS USA, 77:

1 4030-4034, 1980; EP-A-0052522; E-A-0036676; EP-A-  
2 0088046; EP-A-0143949; EP-A-0142541; JP-A-83-11808;  
3 US Patent Nos 4,485,045 and 4,544,545. Ordinarily,  
4 the liposomes are of the small (about 200-800  
5 Angstroms) unilamellar type in which the lipid  
6 content is greater than about 30 mol. % cholesterol,  
7 the selected proportion being adjusted for the  
8 optimal rate of the polypeptide leakage.

9  
10 Examples of the techniques and protocols mentioned  
11 above and other techniques and protocols which may  
12 be used in accordance with the invention can be  
13 found in Remington's Pharmaceutical Sciences, 16<sup>th</sup>  
14 edition, Oslo, A. (ed), 1980.

15  
16 The composition may be administered in a localised  
17 manner to a tumour site or other desired site or may  
18 be delivered in a manner in which it targets tumour  
19 or other cells. Targeting therapies may be used to  
20 deliver the active agent more specifically to  
21 certain types of cell, by the use of targeting  
22 systems such as antibody or cell specific ligands.  
23 Targeting may be desirable for a variety of reasons,  
24 for example if the agent is unacceptably toxic, or  
25 if it would otherwise require too high a dosage, or  
26 if it would not otherwise be able to enter the  
27 target cells.

28  
29 **Pharmaceutical Compositions**

30  
31 As described above, the present invention extends to  
32 a pharmaceutical composition for the treatment of

1 cancer, the composition comprising a naked binding  
2 member which binds to both SCR1 and SCR2 of CD55.  
3 Pharmaceutical compositions according to the present  
4 invention, and for use in accordance with the  
5 present invention may comprise, in addition to  
6 active ingredient, a pharmaceutically acceptable  
7 excipient, carrier, buffer stabiliser or other  
8 materials well known to those skilled in the art.  
9 Such materials should be non-toxic and should not  
10 interfere with the efficacy of the active  
11 ingredient. The precise nature of the carrier or  
12 other material will depend on the route of  
13 administration, which may be oral, or by injection,  
14 e.g. intravenous.

15

16 The formulation may be a liquid, for example, a  
17 physiologic salt solution containing non-phosphate  
18 buffer at pH 6.8-7.6, or a lyophilised powder.

19

#### 20 Dose

21

22 The compositions are preferably administered to an  
23 individual in a "therapeutically effective amount",  
24 this being sufficient to show benefit to the  
25 individual. The actual amount administered, and  
26 rate and time-course of administration, will depend  
27 on the nature and severity of what is being treated.  
28 Prescription of treatment, e.g. decisions on dosage  
29 etc, is ultimately within the responsibility and at  
30 the discretion of general practitioners and other  
31 medical doctors, and typically takes account of the  
32 disorder to be treated, the condition of the

1 individual patient, the site of delivery, the method  
2 of administration and other factors known to  
3 practitioners.

4  
5 The optimal dose can be determined by physicians  
6 based on a number of parameters including, for  
7 example, age, sex, weight, severity of the condition  
8 being treated, the active ingredient being  
9 administered and the route of administration. In  
10 general, a serum concentration of polypeptides and  
11 antibodies that permits saturation of receptors is  
12 desirable. A concentration in excess of  
13 approximately 0.1nM is normally sufficient. For  
14 example, a dose of 100mg/m<sup>2</sup> of antibody provides a  
15 serum concentration of approximately 20nM for  
16 approximately eight days.

17

18 As a rough guideline, doses of antibodies may be  
19 given weekly in amounts of 10-300mg/m<sup>2</sup>. Equivalent  
20 doses of antibody fragments should be used at more  
21 frequent intervals in order to maintain a serum  
22 level in excess of the concentration that permits  
23 saturation of CD55.

24

#### 25 Production of Binding Members

26

27 The binding members of and for use in the present  
28 invention may be generated wholly or partly by  
29 chemical synthesis. The binding members can be  
30 readily prepared according to well-established,  
31 standard liquid or, preferably, solid-phase peptide  
32 synthesis methods, general descriptions of which are

1 broadly available (see, for example, in J.M. Stewart.  
2 and J.D. Young, Solid Phase Peptide Synthesis, 2<sup>nd</sup>  
3 edition, Pierce Chemical Company, Rockford, Illinois  
4 (1984), in M. Bodanzsky and A. Bodanzsky, The  
5 Practice of Peptide Synthesis, Springer Verlag, New  
6 York (1984); and Applied Biosystems 430A Users  
7 Manual, ABI Inc., Foster City, California), or they  
8 may be prepared in solution, by the liquid phase  
9 method or by any combination of solid-phase, liquid  
10 phase and solution chemistry, e.g. by first  
11 completing the respective peptide portion and then,  
12 if desired and appropriate, after removal of any  
13 protecting groups being present, by introduction of  
14 the residue X by reaction of the respective carbonic  
15 or sulfonic acid or a reactive derivative thereof.

16  
17 Another convenient way of producing a binding member  
18 suitable for use in the present invention is to  
19 express nucleic acid encoding it, by use of nucleic  
20 acid in an expression system. Thus the present  
21 invention further provides the use of an isolated  
22 nucleic acid encoding a naked binding member which  
23 binds to both SCR1 and SCR2 of CD55 in the  
24 preparation of an agent for treating cancer.

25  
26 Nucleic acid for use in accordance with the present  
27 invention may comprise DNA or RNA and may be wholly  
28 or partially synthetic. In a preferred aspect,  
29 nucleic acid for use in the invention codes for a  
30 binding member of the invention as defined above.  
31 The skilled person will be able to determine  
32 substitutions, deletions and/or additions to such

1 nucleic acids which will still provide a binding  
2 member of the present invention.

3  
4 Nucleic acid sequences encoding a binding member for  
5 use with the present invention can be readily  
6 prepared by the skilled person using the information  
7 and references contained herein and techniques known  
8 in the art (for example, see Sambrook, Fritsch and  
9 Maniatis, "Molecular Cloning", A Laboratory Manual,  
10 Cold Spring Harbor Laboratory Press, 1989, and  
11 Ausubel et al, Short Protocols in Molecular Biology,  
12 John Wiley and Sons, 1992), given the nucleic acid  
13 sequences and clones available. These techniques  
14 include (i) the use of the polymerase chain reaction  
15 (PCR) to amplify samples of such nucleic acid, e.g.  
16 from genomic sources, (ii) chemical synthesis, or  
17 (iii) preparing cDNA sequences. DNA encoding  
18 antibody fragments may be generated and used in any  
19 suitable way known to those of skill in the art,  
20 including by taking encoding DNA, identifying  
21 suitable restriction enzyme recognition sites either  
22 side of the portion to be expressed, and cutting out  
23 said portion from the DNA. The portion may then be  
24 operably linked to a suitable promoter in a standard  
25 commercially available expression system. Another  
26 recombinant approach is to amplify the relevant  
27 portion of the DNA with suitable PCR primers.  
28 Modifications to the sequences can be made, e.g.  
29 using site directed mutagenesis, to lead to the  
30 expression of modified peptide or to take account of  
31 codon preferences in the host cells used to express  
32 the nucleic acid.

1 The nucleic acid may be comprised as constructs in  
2 the form of a plasmid, vector, transcription or  
3 expression cassette which comprises at least one  
4 nucleic acid as described above. The construct may  
5 be comprised within a recombinant host cell which  
6 comprises one or more constructs as above.  
7 Expression may conveniently be achieved by culturing  
8 under appropriate conditions recombinant host cells  
9 containing the nucleic acid. Following production  
10 by expression a specific binding member may be  
11 isolated and/or purified using any suitable  
12 technique, then used as appropriate.

13  
14 Binding members-encoding nucleic acid molecules and  
15 vectors for use in accordance with the present  
16 invention may be provided isolated and/or purified,  
17 e.g. from their natural environment, in  
18 substantially pure or homogeneous form, or, in the  
19 case of nucleic acid, free or substantially free of  
20 nucleic acid or genes origin other than the sequence  
21 encoding a polypeptide with the required function.

22  
23 Systems for cloning and expression of a polypeptide  
24 in a variety of different host cells are well known.  
25 Suitable host cells include bacteria, mammalian  
26 cells, yeast and baculovirus systems. Mammalian  
27 cell lines available in the art for expression of a  
28 heterologous polypeptide include Chinese hamster  
29 ovary cells, HeLa cells, baby hamster kidney cells,  
30 NSO mouse melanoma cells and many others. A common,  
31 preferred bacterial host is *E. coli*.

32

1 The expression of antibodies and antibody fragments  
2 in prokaryotic cells such as *E. coli* is well  
3 established in the art. For a review, see for  
4 example Plückthun, *Bio/Technology* 9:545-551 (1991).  
5 Expression in eukaryotic cells in culture is also  
6 available to those skilled in the art as an option  
7 for production of a binding member, see for recent  
8 review, for example Reff, *Curr. Opinion Biotech.*  
9 4:573-576 (1993); Trill et al., *Curr. Opinion*  
10 *Biotech.* 6:553-560 (1995).

11  
12 Suitable vectors can be chosen or constructed,  
13 containing appropriate regulatory sequences,  
14 including promoter sequences, terminator sequences,  
15 polyadenylation sequences, enhancer sequences,  
16 marker genes and other sequences as appropriate.  
17 Vectors may be plasmids, viral e.g. 'phage, or  
18 phagemid, as appropriate. For further details see,  
19 for example, Sambrook et al., *Molecular Cloning: A*  
20 *Laboratory Manual*: 2<sup>nd</sup> Edition, Cold Spring Harbor  
21 Laboratory Press (1989). Many known techniques and  
22 protocols for manipulation of nucleic acid, for  
23 example in preparation of nucleic acid constructs,  
24 mutagenesis, sequencing, introduction of DNA into  
25 cells and gene expression, and analysis of proteins,  
26 are described in detail in Ausubel et al. eds.,  
27 *Short Protocols in Molecular Biology*, 2<sup>nd</sup> Edition,  
28 John Wiley & Sons (1992).

29  
30 The nucleic acid may be introduced into a host cell  
31 by any suitable means. The introduction may employ  
32 any available technique. For eukaryotic cells,

1 suitable techniques may include calcium phosphate  
2 transfection, DEAE-Dextran, electroporation,  
3 liposome-mediated transfection and transduction  
4 using retrovirus or other virus, e.g. vaccinia or,  
5 for insect cells, baculovirus. For bacterial cells,  
6 suitable techniques may include calcium chloride  
7 transformation, electroporation and transfection  
8 using bacteriophage.

9  
10 Marker genes such as antibiotic resistance or  
11 sensitivity genes may be used in identifying clones  
12 containing nucleic acid of interest, as is well  
13 known in the art.

14  
15 The introduction may be followed by causing or  
16 allowing expression from the nucleic acid, e.g. by  
17 culturing host cells under conditions for expression  
18 of the gene.

19  
20 The nucleic acid may be integrated into the genome  
21 (e.g. chromosome) of the host cell. Integration may  
22 be promoted by inclusion of sequences which promote  
23 recombination with the genome in accordance with  
24 standard techniques. The nucleic acid may be on an  
25 extra-chromosomal vector within the cell, or  
26 otherwise identifiably heterologous or foreign to  
27 the cell.

28  
29 **Assays**

30  
31 The invention further provides assays for  
32 identification of further agents, for example

1 antibodies that can be used for the enhancement of  
2 complement deposition on a cell sample or tissue and  
3 which can optionally be used in the treatment of  
4 cancer.

5

6 In a preferred aspect, the assay comprises an assay  
7 method for identification of an agent capable of  
8 inhibiting CD55 comprising steps:

9

- 10 a) bringing into contact a candidate agent with at  
11 least a portion of SCR1 and SCR2 of CD55; and  
12  
13 b) determining binding of said candidate agent to  
14 both SCR1 and SCR2.

15

16 In a further embodiment, the assay method comprises  
17 a method for identification of an agent capable of  
18 inhibiting CD55 comprising:

19

- 20 (a) bringing into contact a candidate agent with at  
21 least a portion of SCR1 and SCR2 of CD55 in the  
22 presence of a naked binding member which in the  
23 absence of the candidate agent is capable of  
24 binding both SCR1 and SCR2 of CD55; and  
25  
26 (b) determining the extent to which the candidate  
27 agent inhibits binding of the naked binding  
28 member to SCR1 and SCR2 of CD55.

29

30 The assays may further comprise the step of  
31 selecting a candidate agent which binds both SCR1  
32 and SCR2 of CD55; and/or the step of determining

1 the amount of complement deposition on a cell sample  
2 in the presence and absence of the candidate agent.

3

4 In preferred embodiments of the assays of the  
5 invention, the portion of SCR1 and SCR2 of CD55  
6 comprises amino acids 83-93, 101-112 and 145-157 of  
7 the sequences shown in Figure 1b.

8

9 The present invention further provides a screening  
10 method comprising the step of screening a library of  
11 candidate agents for the ability to inhibit the  
12 binding of a naked binding member to both SCR1 and  
13 SCR2 of CD55.

14

15 The assay of the invention may be a screen , whereby  
16 a number of candidate agents are tested.

17 Accordingly, any suitable technique for screening  
18 compounds known to the person skilled in the art may  
19 be used. The screen may be a high-throughput  
20 screen. For example, WO84/03564 describes a method  
21 in which large numbers of peptides are synthesised  
22 on a solid substrate and reacted with an agent and  
23 washed. Bound entities are detected.

24

25 The invention also contemplates the use of  
26 competitive drug screening assays in which  
27 neutralising antibodies such as 791T/36 capable of  
28 binding SCR1 and 2 of CD55 specifically compete with  
29 a test compound for binding to SCR1 and 2 of CD55.

30

31 Agents identified by the screening method of the  
32 present invention and their use in the manufacture

1 of a medicament for the treatment of cancer are also  
2 contemplated by the invention.

3  
4 Preferred features of each aspect of the invention  
5 are as for each of the other aspects *mutatis*  
6 *mutandis*.

7  
8 The invention will now be described further in the  
9 following non-limiting examples. Reference is made  
10 to the accompanying drawings in which:

11  
12 Figure 1a represents the translated CDR sequences of  
13 VK and VH cDNAs from 105AD7 hybridoma. Uppercase  
14 letters represent the CDR regions, the lower case  
15 letters are the adjacent framework amino acids.

16  
17 Figure 1b shows alignment of the three CDR peptides  
18 with CD55. The amino acid numbering is taken from  
19 the full-length sequence of CD55 including the  
20 leader sequence. CD55 peptides used in subsequent  
21 assays are shown underlined. Bullets (•) represent  
22 amino acid identity whereas amino acids with similar  
23 physicochemical properties are marked as (|).  
24

25 Figure 2 illustrates a C3b complement deposition  
26 assay. 791T cells were incubated with human serum as  
27 a source of complement. C3b deposition was measured  
28 using rabbit anti-C3b FITC labelled antibody in the  
29 presence of blocking (216), non blocking (220) or  
30 test antibody 791T/36. Fluorescence was quantified  
31 by a FACScan flow cytometer and is present as mean  
32 linear fluorescence (MLF).

1 Example 1 CD55 Neutralisation Assay

2

3 Purified CD55 antigen was obtained by  
4 immunoaffinity-matrix purification from octyl-  
5 glucoside-solubilised 791T cells. CD55 cDNA was  
6 cloned and sequenced using primers based on protein  
7 sequence data obtained from the purified antigen  
8 (Spendlove et al., 1999 Cancer Res 59, 2282). The  
9 DNA sequence obtained was identical to that  
10 identified by Caras et al and present on the Genbank  
11 database (Accession No. M31516).

12

13 Cells

14

15 791T is an osteosarcoma cell line which was grown in  
16 RPMI (Gibco, BRL, Paisley, and UK) supplemented with  
17 10% heat inactivated fetal calf serum.

18

19 Monoclonal Antibodies

20

21 Monoclonal antibodies 791T/36 (IgG2b anti-791Tgp72;  
22 Embleton et al 1981Br.J. Cancer 43:582-587), BRIC  
23 216 (IgG1 anti-SCR 3 of CD55; Tate et al 1989  
24 Biochem J 261, 489), BRIC 220 (IgG1 anti-SCR 1 of  
25 CD55, Tate et al 1989 Biochem J 261, 489), BRIC 110  
26 (IgG1 anti-SCR 2 of CD55; Spring et al., 1987  
27 Immunology 62 377; Coyne et al, 1992 J Immunol 149,  
28 2906) have been reported previously. The BRIC  
29 antibodies were purchased from the Blood Group  
30 Reference laboratory (Bristol, UK).

31

32

## 1     **Methods**

2  
3     791T tumour cells that over-express CD55 were washed  
4     with media containing 10% FCS and resuspended at a  
5     density of  $1 \times 10^5$  cells per 100  $\mu$ l. Primary antibody  
6     was incubated with 3x sample volume ( $3 \times 10^5$   
7     cells/300  $\mu$ l) at a concentration of 50  $\mu$ g/ml. Primary  
8     antibodies were positive control antibody, 216  
9     (anti-SCR3), negative control antibody 220 (anti-  
10    SCR1) and test antibody, 791T/36 (anti-SCR1 and 2).  
11    Cells and antibodies were incubated for 1 hr at 4°C  
12    prior to washing in PBS. Samples were split into 3  
13    samples of 100  $\mu$ l per tube. Human Serum was added as  
14    a source of complement to total concentration of 5%  
15    (Not Heat Inactivated). Tubes were inverted several  
16    times and incubate at 37°C for 2 hours, mixing every  
17    30 min. Cells were washed twice in PBS prior to  
18    addition of polyclonal rabbit anti human C3c FITC  
19    conjugated antibody (1/100) to a final volume of  
20    100  $\mu$ l. Cells were incubated for 1 hour at 4°C prior  
21    to washing twice in PBS and resuspending in 200  $\mu$ l of  
22    1% cell fix.

23

## 24    **Results**

25

26    Figure 1 shows that in the presence of a non-  
27    blocking antibody 220 C3b is deposited onto 791T  
28    cells at modest levels (MLF 200). In the presence of  
29    the CD55 neutralising antibody, 216, enhanced C3b  
30    deposition is observed (MLF 350). However in the  
31    presence of monoclonal antibody 791T/36 even greater

1 levels of C3b are deposited (MLF520). This suggests  
2 that although 216 is an effective competitor with C3  
3 convertase for binding to SCR3. binding of 791T/36  
4 to SCR1 and SCR2 domains functionally inactivates  
5 CD55 leading to a 250% increase in C3b deposition.

6

7 **Example 2. Long term survival of recurrent**  
8 **colorectal cancer patients receiving radiolabelled**  
9 **791T/36 for tumour imaging.**

10

# 11 **Antibody and Labelling**

12

13 Hybridoma 791T/36 clone 3 is the source of antibody  
14 (791T/36, IgG2b isotype). Ascitic fluid from mice  
15 in which the hybridoma was developing was applied to  
16 a protein A-"Sepharose" column in pH 7.5 0.1 mol/l  
17 citrate phosphate buffer and the column was  
18 thoroughly washed. Bound immunoglobulins were  
19 eluted stepwise at pH 6.0, 5.0, 4.5 and 3.0 and  
20 these were then dialysed against phosphate-buffered  
21 saline. The dialysate was then centrifuged at  
22 1000000g for 1 h, filtered through a 0.22µm Millex  
23 "Millipore" filter, and stored at -70°C at a protein  
24 concentration of 1mg/ml. The preparation contained  
25 only IgG2b as assessed by immunodiffusion tests with  
26 mouse immunoglobulin typing antisera (Miles  
27 Laboratories, Stoke Poges, Bucks.) and was pyrogen-  
28 free (Boots Pharmaceuticals, Notts).

29

30 Batches of the antibody preparation were labelled  
31 with <sup>131</sup>I by means of "Iodogen" reagent. Non-bound  
32 iodine was removed by gel filtration on sephadex

1 G25. Labelled preparations were diluted into saline  
2 containing 1% serum albumin and sterilised by Millex  
3 filtration.

4  
5 72 patients with recurrent colorectal cancer were  
6 imaged with the radiolabelled monoclonal antibody  
7 791T/36. Patients received an id dose of 10µg of  
8 antibody followed by an intravenous dose of 200µg.  
9 2dl of preparation containing 200µg of antibody and  
10 approximately 70MBq <sup>131</sup>I was infused into an  
11 antecubital vein of each patient over 30 min.

12  
13 Survival was followed for 7 years and compared to a  
14 contemporary group of recurrent colorectal cancer  
15 patients. There were 12 long term survivors (16%)  
16 in the patients who had received 791T/36 where as in  
17 contrast only 1 out of 89 patients survived 7 years  
18 in the contemporary group (p> 0.001).

19  
20 Table 1: Survival of colorectal cancer patients  
21 receiving 791T/36 antibody.

22

| Patients              | Survival | Death |
|-----------------------|----------|-------|
| Imaged with 791T/36   | 12       | 60    |
| Contemporary controls | 1        | 88    |

23

24 These results suggest that there is an apparent  
25 survival benefit in a non-randomised trial of  
26 patients receiving radiolabelled 791T/36 antibody.  
27 The dose of radiolabel reaching the tumour is well  
28 below the level required to elicit tumour killing as  
29 a result of the radiolabel alone. It is therefore

1 more likely that the antibody is inactivating CD55,  
2 allowing complement attack of residual tumour. As  
3 these patients only received a single intravenous  
4 dose of 791T/36 antibody the apparent survival  
5 benefit is very dramatic. Repeat injection with a  
6 humanised 791T/36 antibody may have an even more  
7 pronounced therapeutic benefit.

8  
9 **Example 3. Production of new monoclonal antibodies**  
10 **to SCR1 and SCR2**

11  
12 6-8 week old Balb/c mice were immunised twice 3  
13 weeks apart by intraperitoneal injection with 791T  
14 cells that over-express CD55 antigen ( $10^6$  cells).  
15 Mice were then boosted with SCR1-2 protein fused to  
16 human Fc and purified by protein A chromatography.  
17 Mice were tail bled and serum was screened for their  
18 ability to recognise CD55SCR1-2/CD46SCR3-4 chimeric  
19 molecules expressed by CHO cells as previously  
20 described (Spendlove et al 2000 Eur J Immunol 30,  
21 2944). They were also screened for their ability to  
22 recognise the SCR1-2CD55Fc protein and the IC, 2N  
23 and 2C peptides attached to BSA as previously  
24 described (Spendlove et al 2000 Eur J Immunol 30,  
25 2944). Mice producing antibodies that recognises  
26 CD55SCR1 and SCR2 are boosted by an intravenous  
27 injection of SCR1-2Fc protein and  
28 splenocytes removed 5 days later and fused using PEG  
29 with NSO myeloma cells at a 10:1 ratio. Hybridomas  
30 are selected using HAT medium and screened for  
31 production of antibodies recognising SRR1-2Fc  
32 protein by ELISA. Hybridomas producing the correct

1 antibody are cloned by limiting dilution three times  
2 a 1 cells per well to ensure clonality. The  
3 monoclonal antibody is screened for its ability to  
4 recognise CD55SCR1-2/CD46SCR3-4 chimaeric molecules  
5 expressed by CHO cells as previously described  
6 (Spendlove et al 2000 Eur J Immunol 30, 2944). They  
7 are also screened for their ability to recognise the  
8 SCR1-2CD55Fc protein and the IC, 2N and 2C peptides  
9 attached to BSA as previously described (Spendlove  
10 et al 2000 Eur J Immunol 30, 2944). To determine if  
11 they recognise the same site as 791T/36 plates are  
12 coated with CD55 as described above. They are then  
13 incubated with the new monoclonal antibodies and  
14 then with biotinylated 791T/36. Binding of 791T/36  
15 is quantified by avidin peroxidase and ABTS  
16 substrate and the OD read at 405nm on a plate  
17 reader. If the monoclonal antibodies recognise the  
18 same or related sites to 791T/36 they will inhibit  
19 binding of 791T/36 to CD55 antigen.

20

21 All documents referred to in this specification are  
22 herein incorporated by reference. Various  
23 modifications and variations to the described  
24 embodiments of the inventions will be apparent to  
25 those skilled in the art without departing from the  
26 scope and spirit of the invention. Although the  
27 invention has been described in connection with  
28 specific preferred embodiments, it should be  
29 understood that the invention as claimed should not  
30 be unduly limited to such specific embodiments.  
31 Indeed, various modifications of the described modes  
32 of carrying out the invention which are obvious to

1 those skilled in the art are intended to be covered  
2 by the present invention.

1     **Claims**

2

3     1.    The use of (i) a naked binding member which  
4     binds to both SCR1 and SCR2 of CD55 or (ii) a  
5     nucleic acid encoding said binding member in the  
6     preparation of a medicament for the neutralisation  
7     of CD55.

8

9     2.    The use of (i) a naked binding member which  
10    binds to both SCR1 and SCR2 of CD55 or (ii) a  
11    nucleic acid encoding said binding member in the  
12    preparation of a medicament for the enhancement of  
13    complement deposition on a tissue.

14

15    3.    The use of (i) a naked binding member which  
16    binds to both SCR1 and SCR2 of CD55 or (ii) a  
17    nucleic acid encoding said binding member in the  
18    preparation of a medicament for treating cancer.

19

20    4.    The use according to claim 3 wherein the cancer  
21    is one or more of colorectal, breast , ovarian,  
22    cervical, gastric, lung, liver, skin and myeloid  
23    (e.g. bone marrow) cancer.

24

25    5.    The use according to any one of the preceding  
26    claims wherein the binding member is an antibody or  
27    a fragment thereof.

28

29    6.    The use according to any one of the preceding  
30    claims wherein the binding member binds to amino  
31    acids 83-93 and SCR2 amino acids 101-112 and amino  
32    acids 145-157 of the sequences shown in Figure 1b.

1 7. The use according to any one of the preceding  
2 claims wherein the binding member comprises one or  
3 more of the CDRs of the antibody, or a fragment  
4 thereof, produced by the cell line deposited at ATCC  
5 under accession number HB9173.

6  
7 8. The use according to any one of the preceding  
8 claims wherein the binding member is the antibody  
9 791T/36 produced by the hybridoma cell deposited at  
10 ATCC under accession number HB9173.

11  
12 9. The use according to any one of claims 1 to 7  
13 wherein the binding member comprises at least one  
14 human constant region.

15  
16 10. A naked binding member which binds to both SCR1  
17 and SCR2 for use in the treatment of cancer.

18  
19 11. A naked binding member, which binds to both  
20 SCR1 and SCR2 of CD55, and an active agent as a  
21 combined preparation for simultaneous, separate or  
22 sequential use in the treatment of cancer.

23  
24 12. The naked binding member according to claim 11,  
25 wherein said active agent is a Doxorubicin, taxol,  
26 5-Fluorouracil, Irinotecan or Cisplatin.

27  
28 13. The naked binding member according to any one  
29 of claims 10 to 12, wherein the naked binding member  
30 is as defined in any one of claims 1 to 9.

31

- 1 14. A pharmaceutical composition for the treatment  
2 of cancer, wherein the composition comprises a naked  
3 binding member that binds to both SCR1 and SCR2 of  
4 CD55 and a pharmaceutically acceptable excipient,  
5 diluent or carrier.  
6
- 7 15. The pharmaceutical composition according to  
8 claim 14, wherein the naked binding member is as  
9 defined in any one of claims 1 to 9.  
10
- 11 16. A method of neutralisation of CD55, comprising  
12 administration of a naked binding member which  
13 specifically binds to SCR1 and SCR2 of CD55.  
14
- 15 17. A method of enhancing complement deposition  
16 comprising administration of a naked binding member  
17 which specifically binds to SCR1 and SCR2 of CD55.  
18
- 19 18. A method of treating cancer comprising  
20 administration of a therapeutically effective amount  
21 of a naked binding member which specifically binds  
22 to SCR1 and SCR2 of CD55 to a mammal in need  
23 thereof.  
24
- 25 19. A method according to any one of claims 16 to  
26 18 wherein the naked binding member is as defined in  
27 any one of claims 1 to 9.  
28
- 29 20. An assay method for identification of an agent  
30 capable of inhibiting CD55 comprising step:  
31

- 1 a) bringing into contact a candidate agent with at  
2 least a portion of SCR1 and SCR2 of CD55; and  
3  
4 b) determining binding of said candidate agent to  
5 both SCR1 and SCR2.

6  
7 21. An assay method for identification of an agent  
8 capable of inhibiting CD55 comprising:

- 9  
10 (a) bringing into contact a candidate agent with at  
11 least a portion of SCR1 and SCR2 of CD55 in the  
12 presence of a naked binding member which in the  
13 absence of the candidate agent is capable of  
14 binding both SCR1 and SCR2 of CD55; and  
15  
16 (b) determining the extent to which the candidate  
17 agent inhibits binding of the naked binding  
18 member to SCR1 and SCR2 of CD55.

19  
20 22. The assay method according to claim 21 wherein  
21 the binding member is as defined in any one of  
22 claims 6 to 9.

23  
24 23. The assay method according to any one of claims  
25 20 to claim 22 further comprising step (c) selecting  
26 a candidate agent which bind both SCR1 and SCR2 of  
27 CD55; and/or step (d) determining the amount of  
28 complement deposition on a cell sample in the  
29 presence and absence of the candidate agent.

30  
31 24. The assay method according to any one of claims  
32 20 to 23 wherein said portion of SCR1 and SCR2 of

49

1 CD55 comprises amino acids 83-93, 101-112 and 145-  
2 157 of the sequences shown in Figure 1b.

3

4 25. Use of an agent identified by the assay method  
5 of any one of claims 20 to 24 in the manufacture of  
6 a medicament for the treatment of cancer.
